

Jobsket ATS

Jobsket ATS

Empowering your recruitment process

WELCOME TO JOBSKET ATS

Jobsket ATS is a recruitment and talent acquisition software package built on top of innovation. Our software improves recruitment processes by applying the last advances in semantic technology and artificial intelligence. Our innovative technology allows you to deploy **an absolutely unique talent management software** to your company.

Jobsket ATS is able to automatically read and analyze CVs as human beings would do, so hiring managers do not need to spend hours and hours reading CVs. Our software takes care of parsing, classifying, tagging and valuing automatically all your CVs by using techniques based in artificial intelligence. This means that your company will save a considerable amount of time, paper and money. Not only that but your company's recruitment processes efficiency will be considerably boosted by providing a much better and accurate matching between your candidates and your job offers.

RECRUITMENT PROCESS AUTOMATION

More than five years of research and development allow us to offer you the only tool in the market that makes possible to remove completely data entry and to drastically reduce the CV screening work from the recruiting workflow. That's why our customers are already reporting us reductions up to 70% on the time spent in their recruitment processes.

The image shows a traditional CV form with various sections: 'Spouse's Name', 'Are you or your spouse employed by the U.S. Government?', 'Are you or your business involved in any way at this time?', 'Have you ever filed for personal or business Bankruptcy Protection?', 'Have you ever obtained credit (or any other names)?', 'EDUCATION', 'MILITARY SERVICE BACKGROUND', and 'WORK EXPERIENCE'. A large red 'X' is drawn over the entire form, signifying that such forms are being replaced by digital CVs.

Say goodbye to the forms

With Jobsket ATS none of your employees or candidates will ever have to spend hours and hours again filling up never-ending forms with redundant data that is already available on the CVs.

Moreover, our user interface **allows you to upload thousands of CVs at a time** increasing considerably your productivity.

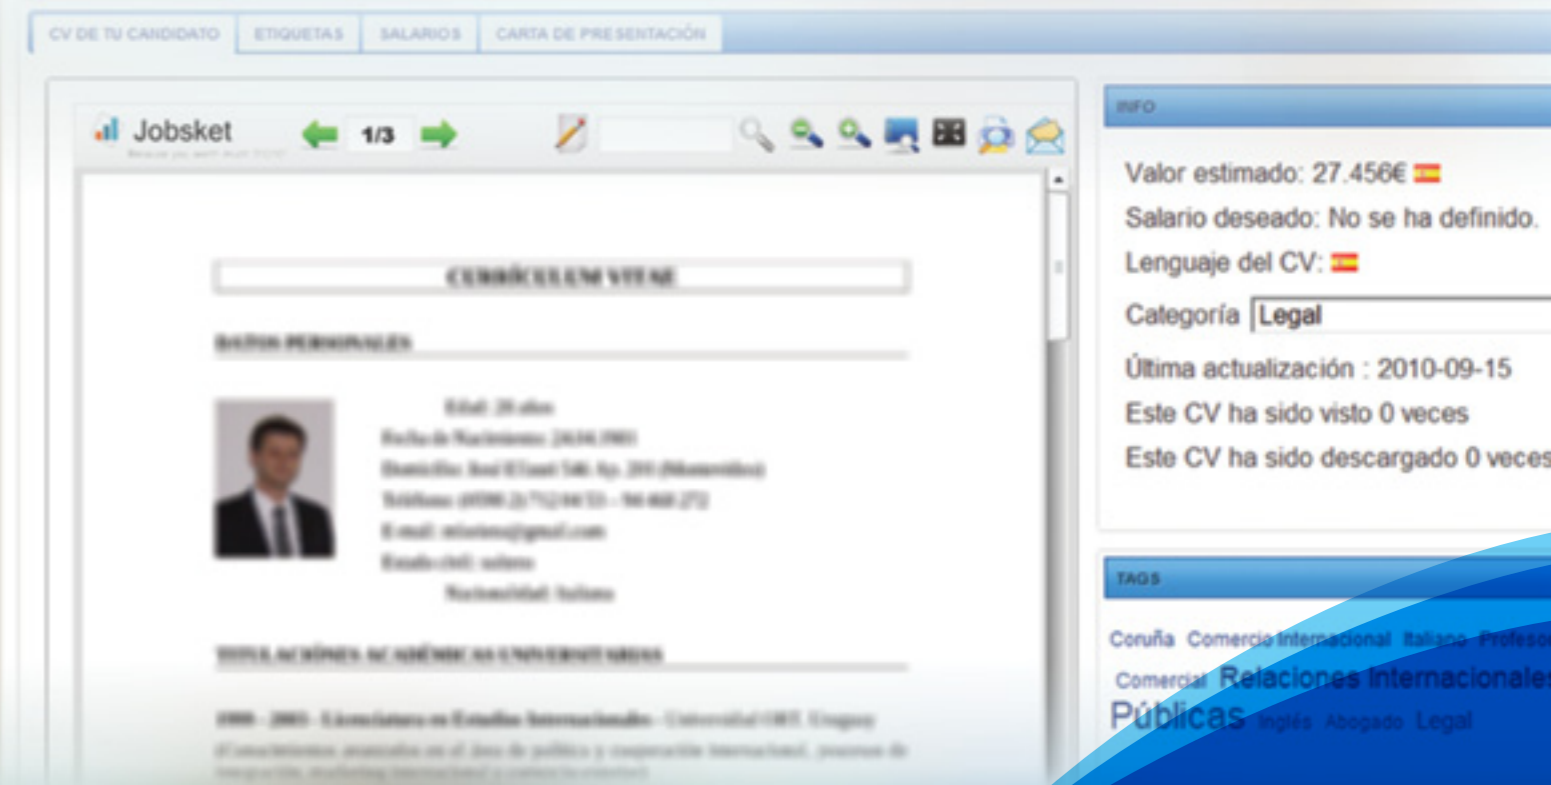

Document Management

Our OCR (Optical Character Recognition) software, exclusive to Jobsket ATS makes possible to extract information from documents that have been scanned from paper. Therefore you will finally be able to digitalize all that information and CVs that is still being kept stored at your office.

Exclusive CVs viewer

Browse CVs online in their original format

Exclusive Viewer. With Jobsket ATS' exclusive viewer you will be able to browse CVs online in their original format. Therefore you don't lose a single bit of information from the original CV and you will be able to share that CV easily with your customers or work colleagues just using simple URLs.

Automatic Update Handling. Jobsket ATS detects automatically CV updates and duplicated CVs, and updates all the information accordingly and sends you notifications about any change. So you won't find you again wasting your time updating repeated profiles into your information systems.

SEMANTIC TECHNOLOGY APPLIED TO HUMAN RESOURCES

Jobsket ATS is the first tool in the market that applies semantic technology to the most common tasks in talent management. Semantic technology can save lots of time and money to human resources departments making their work much more effective and boosting their productivity.

Thanks to the use of several Artificial Intelligence techniques like **Natural Language Processing**, **Data Mining** or **Information Retrieval**, processes in which you currently need to deal with thousands of different applications are reduced to handling a few dozens of CVs that are automatically recommended by **Jobsket ATS'** semantic matching technology.

Semantic Search

Semantic Search engines like the one offered by **Jobsket ATS** are much more powerful than traditional search engines. Our semantic search engine offers common features like keywords search or full-text search (Google like) but at the same time our internal ontologies make possible to us to know more accurately what you are searching for and therefore to solve some common problems that other search engines are unable to handle:

Natural Language Processing	Context Awareness
It is not the same to live in London, to work at the London Group and to live in New York at London Street. Another example, it is not the same to be a DUE (auxiliar nurse) and to make Due Dilligences.	Someone may have worked as a waiter to pay his/her university degree and now may be an important business executive. Probably that person is not interested any more in hospitality related jobs.
Relationships	Multi-Language Capabilities
When you are searching for administrative personnel you won't be interested only in administrative assistants but also in related roles like clerks, office managers, personal assistants and so on.	If you have a multi-language candidates base you probably want to search independently on the language. So searching for "programmers" should return the same results than searching for "programadores".

Automatic Tagging and Classification

Jobsket ATS tags automatically all the incoming CVs using an ontology based tags system. These tags makes possible to classify CVs by roles, skills, places or categories.

You will be able to search CVs by those tags, but no only that, you will also be able to **define your own custom tags** which will help you to create your own bespoke classification criterias.

The Power of the Cloud

Pay only for what you use and obtain the highest availability

SaaS. **Jobsket ATS** is offered in a software as a service (SaaS) format. SaaS software reduces implementation risks and costs and makes possible **to pay only for what you use**. Forget about all those hidden costs, licensing and sustaining costs, installation fees, user fees, etc.

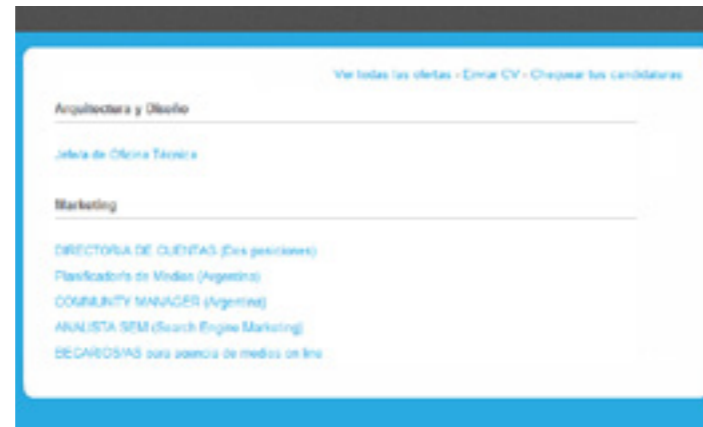

Cloud Computing. Our software is not installed. You won't need neither servers nor an IT consultants team spending months installing software that will never work. **Jobsket ATS is ready to use and runs on the cloud** giving you the highest availability at a very reduced cost.

YOUR OWN CORPORATE JOBSITE IN LESS THAN 30 SECONDS

By the mere fact of signing up into **Jobsket ATS** you will get a corporate jobsite that is ready to be used and that has no hidden extra costs. Moreover you will be able to **link that jobsite with your own custom domain name** which will help you to reinforce your company's brand image and will help to win better candidates.

Jobsket ATS is one of the very few solutions that allow you to create your own corporate jobsite in few seconds, with your own domain name linked to the site and without requiring any installation, servers or an IT department to manage the jobsite. It is quick and straightforward.

If you have more complex projects in mind, our API will help you to take advantage of all **Jobsket ATS'** features without having to make big investments in technology. Contact us and we will help you!

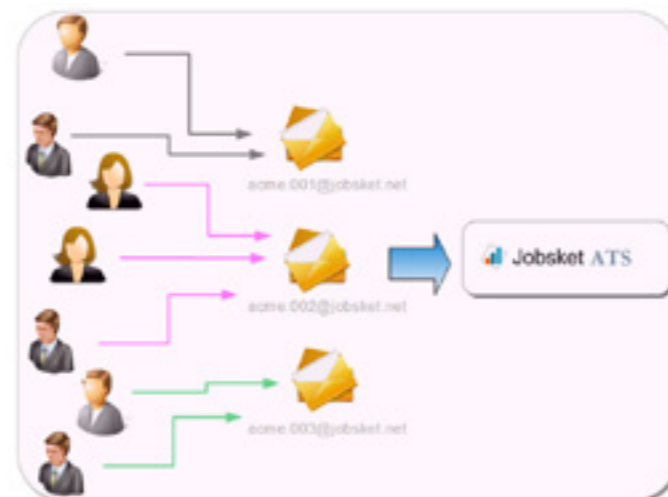

MULTIPOSTING

Jobsket ATS will publish your job offers automatically to your corporate jobsite, to all the jobsites from our business group, to associated job boards, to vertical job engines like Indeed or Trovit and finally also to social networks like Twitter, LinkedIn or Facebook. In this way you **centralize applications processing** and at the same time you are publishing up your job offers in many different sources.

SMART INBOXES

When you create a job offer in **Jobsket ATS** our system creates automatically smart inboxes that make possible to receive and to process applications automatically from your email.

Our system analyzes incoming emails and transforms them automatically into applications saving you a considerable amount of time.

Business Intelligence and HR

Handle all your data visually in the simplest and most effective way

Jobsket BI is a complementary product to **Jobsket ATS** that offers to the user an innovative visual user interface that makes possible to browse over hundreds of thousands of CVs in a very simple and intuitive way.

Business Intelligence combined with the use of semantic technology will allow you to obtain unknown statistics and data that were in your system but that you were absolutely unaware of and that will allow you to be much more efficient and to drastically improve your business dynamics.
